

# Class Attribute

- The class attribute is used to specify a class for an element. Multiple elements can share the same value of the class.

## Example:

```
<div class="city">
```

```
  <h2>London</h2>
```

```
  <p>London is the capital of England.</p>
```

```
</div>
```

# id Attribute

- The id attribute specifies a unique id for an element. The value of the id attribute must be unique within the HTML document.
- You cannot have more than one element with the same id in an HTML document.

## Example:-

```
<h1 id="myHeader">My Header</h1>
```

# Difference Between Class and ID

- A class name can be used by multiple elements, while an id name must only be used by one element within the page
